Attempt : 1
Total Mark : 20
Marks Obtained : 10

Section 1 : Project

1. Problem Statement

Create a JDBC-based Hospital Management System that handles runtime input to manage patient records. The system should allow users to:

Add a new patient (patient ID, name, age, status).

Update a patient's status.

View a specific patient's record by patient ID.

Display all patient records in the database.

Exit the application.

The system should connect to a MySQL database using the following default credentials:

DB URL: jdbc:mysql://localhost/ri_db

USER: test

PWD: test123

The patients table has already been created with the following structure:

Table Name: patients

Input Format

The first line of input consists of an integer choice, representing the operation to be performed:

(1 for Add Patient, 2 for Update Patient Status, 3 for View Patient Record, 4 for Display All Patients, 5 for Exit)

For choice 1 (Add Patient):

- The second line consists of an integer patient_id.
- The third line consists of a string name.
- The fourth line consists of an integer age.
- The fifth line consists of a string status.

For choice 2 (Update Patient Status):

- The second line consists of an integer patient_id.
- The third line consists of a string new_status.

For choice 3 (View Patient Record):

- The second line consists of an integer patient_id.

For choice 4 (Display All Patients):

- No additional inputs are required.

For choice 5 (Exit):

- No additional inputs are required.

Output Format

For choice 1 (Add Patient):

- Print "Patient added successfully" if the patient was added.
- Print "Failed to add patient." if the insertion failed.

For choice 2 (Update Patient Status):

- Print "Patient status updated successfully" if the update was successful.
- Print "Patient not found." if the specified patient ID does not exist.

For choice 3 (View Patient Record):

- Display the patient details in the format:
- ID: [patient_id] | Name: [name] | Age: [age] | Status: [status]
- Print "Patient not found." if the specified patient ID does not exist.

For choice 4 (Display All Patients):

- Display each patient on a new line in the format:
- ID | Name | Age | Status
- If no records are available, print nothing (or handle it with an appropriate message if desired).

For choice 5 (Exit):

- Print "Exiting Hospital Management System."

For invalid input:

- Print "Invalid choice. Please try again."

Sample Test Case

Input: 1
101
John Doe
45
Admitted
4

5
Output: Patient added successfully
ID | Name | Age | Status
101 | John Doe | 45 | Admitted
Exiting Hospital Management System.

Answer

```
import java.sql.*;
import java.util.Scanner;

class HospitalManagementSystem {
   public static void main(String[] args) {
      try (Connection conn = DriverManager.getConnection("jdbc:mysql://
localhost/ri_db", "test", "test123");
          Scanner scanner = new Scanner(System.in)) {

         boolean running = true;

         while (running) {

            int choice = scanner.nextInt();

            switch (choice) {
               case 1:
                  addPatient(conn, scanner);
                  break;
               case 2:
                  updatePatientStatus(conn, scanner);
                  break;
               case 3:
                  viewPatientRecord(conn, scanner);
                  break;
               case 4:
                  displayAllPatients(conn);
                  break;
               case 5:
                  System.out.println("Exiting Hospital Management System.");
                  running = false;
                  break;
               default:
                  System.out.println("Invalid choice. Please try again.");
            }
```

```
            }
        } catch (SQLException e) {
            e.printStackTrace();
        }
    }

public static void addPatient(Connection conn, Scanner scanner) {
    try {
        int id = scanner.nextInt();
        scanner.nextLine();
        String name = scanner.nextLine();
        int age = scanner.nextInt();
        scanner.nextLine();
        String status = scanner.nextLine();

        Statement stmt = conn.createStatement();
        String query = "INSERT INTO patients (patient_id, name, age, status) VALUES
(" +
                id + ", '" + name + "', " + age + ", '" + status + "')";
        int rows = stmt.executeUpdate(query);

        if (rows > 0)
            System.out.println("Patient added successfully");
        else
            System.out.println("Failed to add patient.");
    } catch (Exception e) {
        System.out.println("Failed to add patient.");
    }
}

public static void updatePatientStatus(Connection conn, Scanner scanner) {
    try {
        int id = scanner.nextInt();
        scanner.nextLine();
        String newStatus = scanner.nextLine();

        String query = "UPDATE patients SET status = ? WHERE patient_id = ?";
        PreparedStatement pstmt = conn.prepareStatement(query);
        pstmt.setString(1, newStatus);
        pstmt.setInt(2, id);

        int rows = pstmt.executeUpdate();
```

```
            if (rows > 0)
                System.out.println("Patient status updated successfully");
            else
                System.out.println("Patient not found.");
        } catch (Exception e) {
            System.out.println("Patient not found.");
        }
    }

    public static void viewPatientRecord(Connection conn, Scanner scanner) {
        try {
            int id = scanner.nextInt();

            String query = "SELECT * FROM patients WHERE patient_id = ?";
            PreparedStatement pstmt = conn.prepareStatement(query);
            pstmt.setInt(1, id);

            ResultSet rs = pstmt.executeQuery();

            if (rs.next()) {
                System.out.println("ID: " + rs.getInt("patient_id") +
                        " | Name: " + rs.getString("name") +
                        " | Age: " + rs.getInt("age") +
                        " | Status: " + rs.getString("status"));
            } else {
                System.out.println("Patient not found.");
            }
        } catch (Exception e) {
            System.out.println("Patient not found.");
        }
    }

    public static void displayAllPatients(Connection conn) {
        try {
            Statement stmt = conn.createStatement();
            String query = "SELECT * FROM patients";

            ResultSet rs = stmt.executeQuery(query);

            System.out.println("ID | Name | Age | Status");
            boolean found = false;
```

```
        while (rs.next()) {
            found = true;
            System.out.println(
                rs.getInt("patient_id") + " | " +
                rs.getString("name") + " | " +
                rs.getInt("age") + " | " +
                rs.getString("status")
            );
        }
    } catch (Exception e) {
    }
}
```

```
}
```

Status : Correct **Marks : 10/10**

2. Problem Statement

In Café Central, the menu is cataloged and stored in a database.

To efficiently manage the restaurant's menu using Java and JDBC, you must build a Restaurant Management System that supports:

Adding new menu items

Updating menu item prices

Viewing details of a menu item

Displaying all menu items in sorted order

You are given two files:

File 1: MenuItem.java (POJO Class)

This class represents the MenuItem entity.

A MenuItem contains the following details:

Field Description

itemId Unique Menu Item ID (Integer)

name Item Name (String)

category Item Category (String)

price Item Price (Double)

Students must write code in the marked area:

```
class MenuItem {
    private int itemId;
    private String name;
    private String category;
    private double price;

    public MenuItem() {}

    public MenuItem(int itemId, String name, String category, double price) {
        // write your code here
    }

    // Include getters and setters
}
```

Expected in this part:

Assign parameter values to instance variables inside the constructor.

Add getters and setters for all attributes.

File 2: MenuItemDAO.java (Data Access Layer)

This class handles all database operations using JDBC.

Students must complete the missing JDBC logic in the following methods:

```
class MenuItemDAO {

    public void addMenuItem(Connection conn, MenuItem menuItem)
throws SQLException {
        // write your code here
    }

    public void updateItemPrice(Connection conn, int itemId, double
newPrice) throws SQLException {
        // write your code here
    }

    public void deleteMenuItem(Connection conn, int itemId) throws
SQLException {
        // write your code here
    }

    public MenuItem viewItemDetails(Connection conn, int itemId) throws
SQLException {
        // write your code here
    }

    public List<MenuItem> displayAllMenuItems(Connection conn) throws
SQLException {
        // write your code here
    }

    private MenuItem mapToMenuItem(ResultSet rs) throws SQLException {
        return new MenuItem(
            // write your code here
        );
    }
```

}

Expected in this part:

Write SQL queries for INSERT, UPDATE, DELETE, SELECT.

Execute queries using PreparedStatement or Statement.

Map ResultSet rows to MenuItem objects using mapToMenuItem().

Return a List<MenuItem> where required.

The system should connect to a MySQL database using the following default credentials:

DB URL: jdbc:mysql://localhost/ri_db

USER: test

PWD: test123

The menu table has already been created with the following structure:

Table Name: menu

Input Format

The first line of input consists of an integer choice, representing the operation to be performed (1 for Add Item, 2 for Restock item, 3 for reduce item, 4 for Display, 5 for Exit).

For choice 1 (Add Menu Item):

- The second line consists of an integer item_id.
- The third line consists of a string name.
- The fourth line consists of a string category.
- The fifth line consists of a double price.

For choice 2 (Update Item Price):

- The second line consists of an integer item_id.
- The third line consists of a double new_price.

For choice 3 (View Item Details):

- The second line consists of an integer item_id.

For choice 4 (Display All Menu Items):

- No additional inputs are required.

For choice 5 (Exit):

- No additional inputs are required.

Output Format

For choice 1 (Add Menu Item):

- Print "Menu item added successfully" if the item was added.
- Print "Failed to add item." if the insertion failed.

For choice 2 (Update Item Price):

- Print "Item price updated successfully" if the price update was successful.
- Print "Item not found." if the specified item ID does not exist.

For choice 3 (View Item Details):

- Display the item details in the format:
- ID: [item_id] | Name: [name] | Category: [category] | Price: [price]
- Print "Item not found." if the specified item ID does not exist.

For choice 4 (Display All Menu Items):

- Display each item on a new line in the format:
- ID | Name | Category | Price
- If no items are available, print nothing (or handle with an appropriate message if desired).

For choice 5 (Exit):

- Print "Exiting Restaurant Management System."

For invalid input:

- Print "Invalid choice. Please try again."

Sample Test Case

Input: 1
11
Margherita Pizza
Main Course
12.99
4
5

Output: Menu item added successfully
ID | Name | Category | Price
11 | Margherita Pizza | Main Course | 12.99
Exiting Restaurant Management System.
